oomnitza

Accessories Module

Oomnitza is an agentless Enterprise Technology Management (ETM) solution that enables you to manage all of your technology portfolio assets from a single integrated view. The Accessories Asset Module enables you to keep track of those ancillary but important components in your IT ecosystem, from keyboards and mice to monitors and printers to docking stations, webcams and wireless headsets, all of which are critical requirements for efficient workflows and productive employees in a dynamic and dispersed hybrid workforce.

With 600 integration points from over 100 technologies, Oomnitza enables you to easily provide and track the tools your modern dynamic enterprise needs to keep teams productive.

Business Challenge

Every organization leverages technology to manage its critical IT and business processes across the enterprise. Often, there are dozens of tools used to manage an ever-growing inventory of technology assets. But these tools are managed by different groups with little coordination between them to get valuable insight into the big picture of enterprise technology.

IT Operations and Procurement teams need the right information, at the right time, to make the best decisions. And these teams spend far too much time just to collect the information they need. Compounding this challenge is the fact that our modern dynamic dispersed workforce has placed new demands on managing and tracking unique items that ensure their productivity, engagement and satisfaction.

This causes a disconnect between IT Operations, Procurement, Human Resources and finance teams that makes tracking and managing assets throughout their lifecycle difficult, especially for the modern hybrid workforce. The result is spending far more on assets than necessary as asset utilization, inventory and demand is not seen in one holistic view.

Key Benefits

- Support your hybrid and remote workforce with the tools they need to stay productive and engaged

- Improve management of consumables inventory to help reduce costs

- Improve budgeting and forecasting with improved and accurate inventory control

- Enable your procurement teams to make better purchasing decisions

- Enhanced employee satisfaction by ensuring alternatives are available when items are backordered

Key Features

- Track accessories and optimize stockroom inventory levels to ensure key items are available when needed

- Technology agnostic APIs enable integration with a wide variety of systems and technologies to present a unified view of software assets, cloud infrastructure usage and SaaS subscriptions

- Flexible data model enables you to define any number of custom fields and map in data from any source

- Event driven architecture allows you to take almost any action from criteria you set

- Proactive notifications alert to re-order accessories

Solution Overview

Oomnitza is the developer of Enterprise Technology Management, which enables you to keep track of those ancillary but important components of your IT ecosystem, from keyboards and mice to monitors and printers to docking stations, webcams and wireless headsets, all of which are critical requirements for efficient workflows and productive employees in a dynamic hybrid workforce.

With the Accessories Module, you can:

Maintain accurate inventory. Keep budgets in check by tracking accessories and better optimize stockroom inventory levels.

Support your remote workforce. Ensure you have the approved webcams, headsets and other accessories so they can be productive from any location.

Enhance employee satisfaction. Prevent stockouts and ensure alternative accessories are available when inventories are depleted.

Be one step ahead in a highly dynamic IT environment. Enable procurement to reorder the most popular items to anticipate demand.

Reduce costs through more efficient IT spend. Dramatically improve inventory planning, forecasting and auditing.

Gives you a razor-sharp view into the dynamics of your cloud, SaaS and software ecosystem, tightly coupled with your hardware infrastructure.

Critical Differentiators

Oomnitza includes out-of-the box integrations with an extensive catalog of products, technologies and vendors and we add to this list every week. In addition, Oomnitza features a flexible data model, which allows an enterprise to decide what data they want to track from a wide variety of systems, assets, software, cloud infrastructure, SaaS solutions and management tools.

We also have a purpose-built workflow engine, allowing customers to proactively react to any changes in the data and schedule the run of workflows. When relevant data changes, a workflow is triggered that allows you to automatically communicate via email, Slack, or by calling an API. An API allows full bi-directionality to isolate a specific endpoint and and manage or configure it via integration with an endpoint management tool such as Jamf or Tanium. All companies run on workflows, and all workflows rely on technology, which Oomnitza can fully automate at scale.

Integrations

Oomnitza includes an extensive portfolio of integrations that enable you to manage your entire technology ecosystem from a single console. Oomnitza features over 600 integration points from over 100 technologies across virtually every category in the enterprise including cloud and SaaS, ITSM and CMDB, endpoint and multi-cloud security, datacenter and network, financial and human capital management. And our engineering team continually expands the integration catalog based on customer requests.
